

LAP System Permission-Based Module Workflows

Login and permissions

1. Admin or Superadmin creates an employee in LAP.
2. Admin grants per-employee permissions from Permission Manager.
3. Employee logs in and receives permission codes in the JWT/auth state.
4. Sidebar and module screens show only workflows allowed by those codes.
5. Backend APIs also check the same permission codes, so hidden UI is not the only protection.

Admin and Superadmin

- Full access by role.
- Can see all modules and all protected workflows.

Managers, HR, Employees

- See only explicitly granted UserPermissionOverride permissions.
- Example: view_tasks shows own task dashboard and my tasks only.
- Example: create_task shows create task workflow but not full team task board unless view_team_tasks or assign_task is also granted.

Tasks Module Flow

Permissions

- view_tasks: own task dashboard, my tasks, notifications.
- view_team_tasks: task list, kanban, calendar, team task dashboard.
- create_task: create task workflow.
- edit_task: update task details/status.
- delete_task: delete tasks.
- assign_task: assign tasks and see team task workflows.

Assignment workflow

1. Admin/manager/HR with create_task or assign_task opens Tasks.
2. Create Task loads active employees from /api/tasks/members/.
3. Assigner selects employee, priority, due date, related module, and saves.
4. Backend stores task with assigned_by and assigned_to.
5. Assigned employee with view_tasks sees it in own task dashboard/my tasks.
6. Team users with view_team_tasks or assign_task see all tenant tasks.
7. Comments, status changes, archive, and notifications are saved through backend APIs.

Leads and Follow Ups Flow

Permissions

- view_leads: see assigned leads or all leads if also assign_lead/view_lead_analytics.
- create_lead: add lead.
- edit_lead: edit lead.
- delete_lead: delete lead.
- assign_lead: assign counselors and view broader lead pool.
- view_followups: see follow-up records.
- create_followup: log lead conversations and reminders.
- manage_lead_forms: form builder.
- view_lead_analytics: analytics dashboard.

Lead workflow

1. User with create_lead adds a lead using active intake form.
2. If user lacks assign_lead, backend assigns the lead to that user.
3. User with view_leads sees only allowed leads.
4. User with create_followup logs conversation from Lead Details.
5. Follow Ups page shows pending/completed follow-up actions.
6. Analytics is visible only with view_lead_analytics.

Revenue and Affiliate Flow

Revenue permissions

- view_revenue: open Revenue dashboard.
- manage_revenue: future management workflow access.

Revenue workflow

1. Revenue dashboard calls /api/revenue/overview/.
2. Backend checks view_revenue.
3. Revenue is calculated from lead fields named Revenue, Fee, Course Fee, or Amount.
4. Admission Confirmed leads count as confirmed revenue.
5. Interested and Follow-Up Pending leads count as pipeline revenue.

Affiliate permissions

- view_affiliate: open affiliate dashboard workflows.
- manage_affiliate: manage affiliate workflows.

Affiliate workflow

1. Sidebar shows Affiliate only when permission is granted.
2. Affiliate backend endpoints require view_affiliate or manage_affiliate.
3. Public affiliate/customer registration remains public.
4. Dashboard, referrals, commissions, payments, profile, and notifications are permission-protected.

Operational Checklist

After code update

1. Run backend migrations.
`python manage.py migrate`
2. Seed permissions.
`python manage.py seed_permissions`
3. Restart backend server.
4. Restart frontend dev server if needed.
5. Login as admin or superadmin.
6. Open Permission Manager.
7. Grant employee permissions by module.
8. Logout/login as employee to refresh token permissions.

Expected examples

- Employee with `view_tasks` only: sees Tasks, Dashboard, My Tasks, Notifications.
- Employee with `create_task` only: sees Create Task only.
- Counselor with `view_leads` and `create_followup`: sees leads and follow-ups they are allowed to access.
- Revenue user with `view_revenue`: sees Revenue dashboard without needing `view_leads`.
